Step One: Pick Project Ideas

Idea: Building an Instagram Clone with Custom Node.js Backend API and React Frontend

- **Objective**: Demonstrate proficiency in full-stack development by creating an Instagram clone that replicates the features and user flow of an earlier version of Instagram focused solely on photograph sharing.
- **Technology Stack**: Custom Node.js backend API implementing CRUD operations following RESTful architectural guidelines. React frontend for the user interface.

Reason for Choosing This Idea

- The primary goal of this project is to showcase my capabilities in full-stack development. By building a custom Node.js backend API and a React frontend, I aim to replicate the core functionalities of an earlier version of Instagram, emphasizing photo sharing, user profiles, likes, and comments. This project will allow me to deepen my understanding of backend development, API design, database management, and front-end implementation using modern technologies.
